STREAMLINE WASTE DIVERSION REPORTING WITH UL TURBO WASTE™

UL software provides visibility into waste streams and management across the supply chain.

Waste reduction is pivotal to sustainability and a fundamental tenant of circularity. Fierce competition in industries drives slimmer margins, making effective waste management operations a cornerstone of financial success. Additionally, the global regulatory landscape continues to evolve, requiring increasing degrees of waste reporting and diversion from landfills. Effective measurement and reporting calls for visibility across the supply chain to understand the full waste footprint of operations.

UL's Turbo Waste platform is designed for large enterprises with multiple sites and complex supply chains. The platform helps you quickly collect, aggregate and analyze data on your company and vendor's waste streams and disposal methods. In addition, you can collect and analyze the environmental benefit of your waste diversion activities in the form of reduced carbon impacts. With detailed, comprehensive reporting, enterprises gain valuable insight into their waste generation activities.

Did you know?

- Waste reduction is a sustainability priority. A survey from GlobeScan asked experts to identify the most urgent environmental issues and 74% identified waste as an urgent sustainability challenge. (Source: GlobeScan. (2019). SustainAbility Survey.)

- Growing demand for environmental, social and governance (ESG) reporting, the pursuit of the UN's Sustainable Development Goals (SDGs) and requirements of leading green building programs, like LEED, encourage meaningful waste management.
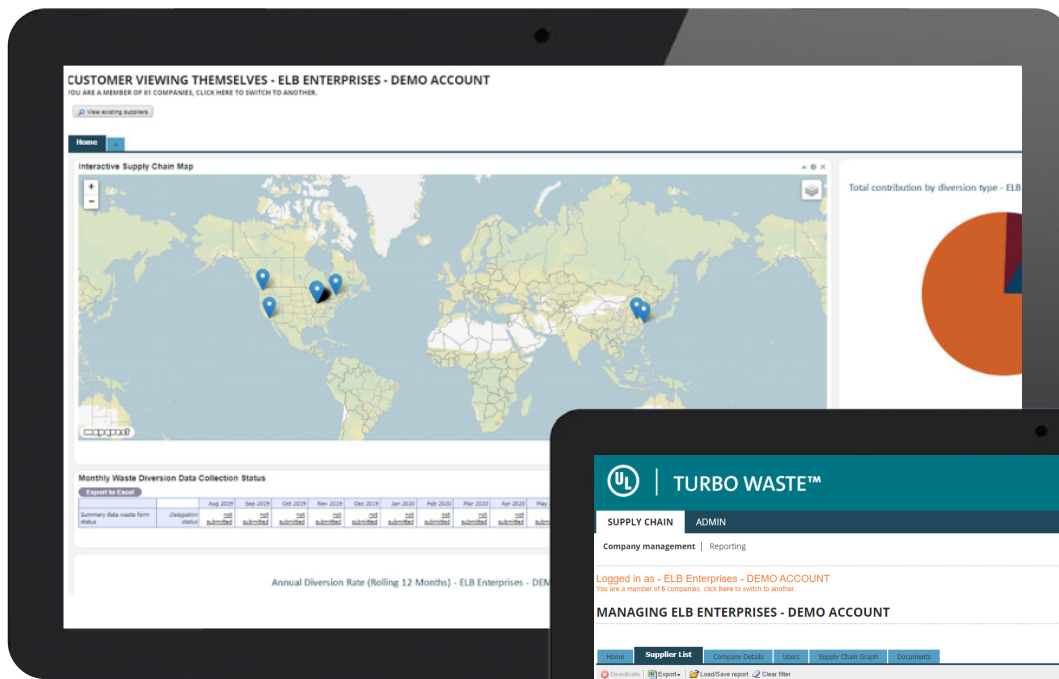

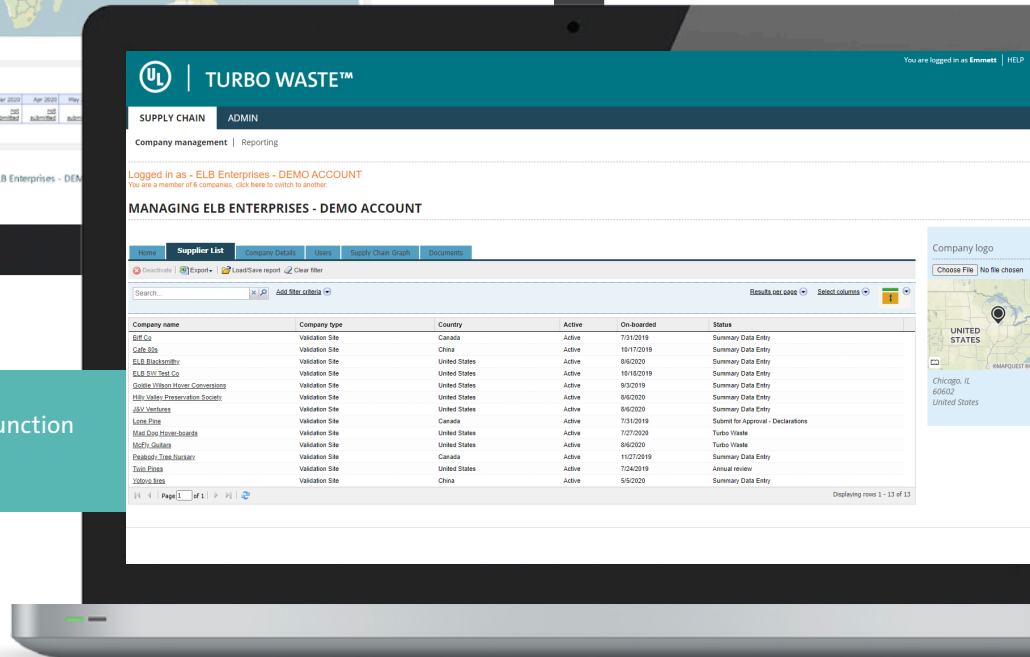

How it works

Small to large companies can use Turbo Waste software to create instances for all facilities in their supply chain to report monthly waste diversion activities. Aggregated in real time, managers gain instant access to the most recent consolidated data. Using Turbo Waste, companies can:

- Easily manage large portfolios of sites and gain visibility regarding waste diversion performance across the entire supply chain
- Reduce time and cost associated with data collection and production
- Increase the consistency and coverage of waste data across the supply chain
- Quickly identify areas for waste diversion improvement
- Access dashboards and drill down into details to better understand type and volume of materials that are reused, recycled or diverted from the landfill
- Streamline ESG reporting and data submitted for other sustainability initiatives

Powerful dashboards provide at-a-glance insight and can easily be shared with executives and other key stakeholders.

Take your waste diversion to the next level by validating your claims

For customers interested in differentiating themselveswith a third-party validated waste diversion claim, Turbo Waste offers direct integration with the UL 2799, Environmental Claim Validation Procedure for Zero Waste to Landfill program. With the certification program, companies can validate their waste diversion rates and confidently communicate them to the market with true transparency.

Turbo Waste provides a simple, cost-effective solution to gain visibility into waste management practices and advance sustainability in business. Are you ready to turbocharge your waste diversion programs?
